Vx Aviation Enhances EFIS Wiring Hub Family

VICTORIA, BC---February 15, 2011---Vx Aviation today announced the introduction of three new AXIS™ wiring hub devices for the interconnect of Electronic Flight Information Systems (EFIS) to other avionics and instrumentation behind the instrument panel in owner-built aircraft.

The new AXIS-9A, AXIS-25A and GBX-25A join the previously announced AXIS-15A to provide a complete family of wiring hubs. The AXIS-9A is specific to the Dynon SkyView Network and functions as a multi-port splitter, providing a 9-wire backplane and allowing up to five SkyView Network compatible instruments to be connected together. The AXIS-25A is a general-purpose 25-wire backplane with five connectors that facilitate the wiring of modern avionics panels that have a large number of RS-232, ARINC-429 and similar data interconnects, such as would be found on IFR panels. The GBX-25A is a ground bus wiring block that simplifies the distribution of low-current ground or power by providing 25 bused connections.

These new products join the existing AXIS-15A device which combines a five-connector, 15-wire backplane combined with two ground/power distribution blocks. The AXIS-15A is appropriate for most VFR panels.

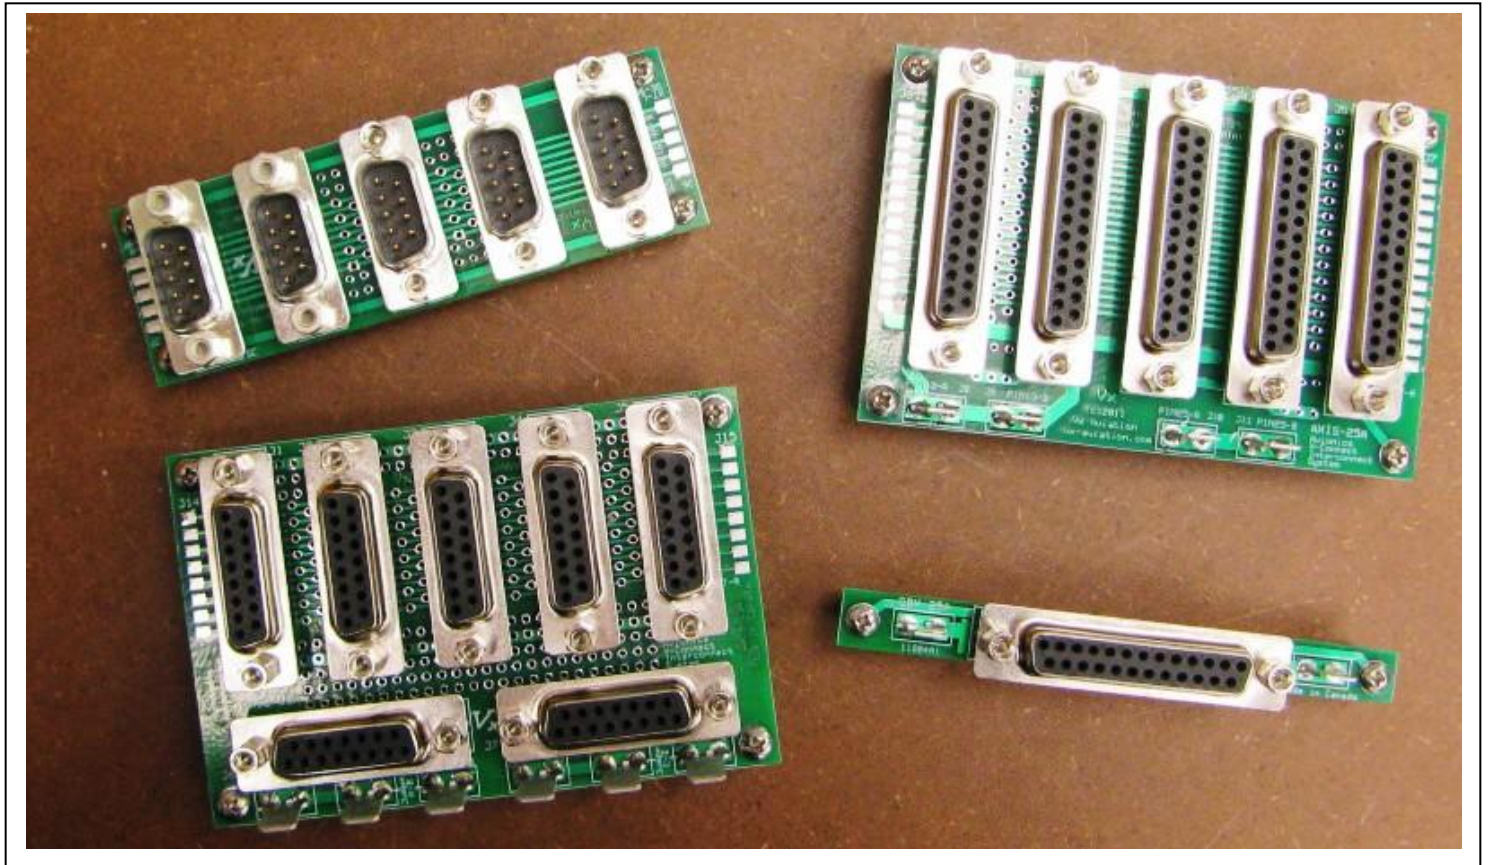

The AXIS product family is smaller, lighter, less expensive and less labor intensive than discrete wiring harnesses. Reliability is improved by reducing spliced connections and modifications or additions to instrumentation are facilitated without changing existing wiring, simply by plugging in new terminals.

Design examples are provided in the installation manual available on the Vx Aviation website www.vx-aviation.com.

The AXIS-9A, AXIS-15A, AXIS-25A and GBX-25A are available from stock. Price for the AXIS-9A is \$95.00, The AXIS-15A and AXIS-25A are \$150.00, including mating connector kits and the GBX-25A is \$35.00, including the mating connector kit.
